

In the above picture,  $\triangle ABC$  is inscribed in the circle.  $O$  is its orthocentre and  $AD$  is the diameter of the circle.  $DO$  is produced to meet the other side of the circle at  $E$ .

Prove:  $BE^2 + EC^2 + CD^2 + DB^2 = 2DE^2$ .

**Author's Solution**

**Given :**

$\Delta ABC$  is inscribed in the circle.  $O$  is its orthocentre and  $AD$  is the diameter.  $DO$  produced meets the circle at  $E$ .

**To Prove :**

$$BE^2 + EC^2 + CD^2 + DB^2 = 2DE^2.$$

**Construction:**

Produce  $AO$  to meet  $BC$  and the circle at  $F$  &  $G$  respectively. Produce  $CO$  to meet  $AB$  at  $H$ . Join  $BO$  &  $DG$ . Let  $DE$  &  $BC$  meet at  $M$ .

**Solution :**

$BOCD$  is a parallelogram.

This can be proved in many ways. Here, the following method is employed.

$$\angle HAO = \angle FCO \text{ ----- (1)}$$

[ $O$  is orthocentre.  $AF \perp BC$  &  $CH \perp AB$  and  $AHFC$  is concyclic]

$$\angle BAG = \angle BCG \quad [\text{BACG is concyclic}]$$

$$\text{i.e., } \angle HAO = \angle FCG \text{ ----- (2)}$$

(1) & (2)  $\rightarrow$

$$\angle FCO = \angle FCG$$

$\therefore$   $FC$  is perpendicular bisector of  $OG$ .

$$\text{And } OC = CG \text{ ----- (3)}$$

$AD$  is diameter

$$\therefore \angle AGD = 90^\circ$$

$$\therefore BC \parallel DG$$

And BCGD is an isosceles trapezium. (Any trapezium with concyclic vertices is an isosceles trapezium)

$$\therefore CG = BD \text{ ----- (4)}$$

$$(3) \ \& \ (4) \rightarrow OC = BD \text{ -----(5)}$$

CH  $\parallel$  BD [CH is altitude and  $\angle ABD$  is right angle]

$$\Rightarrow CO \parallel BD \text{ ----- (6)}$$

$$(5) \ \& \ (6) \rightarrow$$

BOCD is parallelogram.

$\therefore$  M is the midpoint of BC, the diagonal.

$\Rightarrow$  EM & DM are medians of  $\Delta BEC$  &  $\Delta BDC$  respectively.

$\therefore$  As per Apollonius Theorem,

$$BE^2 + EC^2 = 2(EM^2 + BM^2) \text{ ----- (7)}$$

$$\text{And } CD^2 + DB^2 = 2(DM^2 + BM^2) \text{ ----- (8)}$$

$$(7) + (8) \rightarrow$$

$$\begin{aligned} BE^2 + EC^2 + CD^2 + DB^2 &= 2(EM^2 + DM^2 + 2BM^2) \\ &= 2[EM^2 + DM^2 + 2(EM \times DM)] \\ &= 2(EM + DM)^2 \end{aligned}$$

$$BE^2 + EC^2 + CD^2 + DB^2 = 2DE^2 \text{ ----- Proved}$$
